A certain complete space-like hypersurface in Lorentz manifolds

Hyang Sook Kim and Young-Mi Kim

Abstract

In this paper, we find an upper bound of the squared norm of the second fundamental tensor of a complete space-like hypersurface in a Lorentz space form $M_1^m(c)$ satisfying some curvature conditions. Then it gives naturally an extension of some theorems of Cheng and Nakagawa ([3]), Ishihara ([7]), Li ([8]) and Nishikawa ([9]).

Mathematics Subject Classification: 53C50, 53C25, 53C42.

Key words: space-like hypersurface, constant mean curvature, locally symmetric, maximal space-like, totally geodesic.

1 Introduction

In connection with the negative settlement of the Berstein problem by Calabi ([2]), Cheng-Yau ([4]) and Chouque-Bruhat et al.([6]) proved the following famous theorem independently.

Theorem A Let M be a complete space-like Lorentz space form $M_1^{n+1}(c)$, c > 0. If M is maximal, then it is totally geodesic.

On the other hand, complete space-like hypersurface with constant mean curvature in a Lorentz space form $M_1^m(c)$ are investigated by many differential geometers in various view points; for example Akutagawa ([1]), Cheng and Nakagawa ([3]), Li ([8]), Nishikawa([9]) and Ramanathan ([11]). In this paper, we'll give an upper bound of the sequared norm of the second fundamental form, of complete space-like hypersurface with constant mean curvature in a Lorentz space form $M_1^m(c)$. Namely, the following assertion is our main theorem.

Main Theorem Let M' be an (n + 1)-dimensional Lorentz manifold which satisfies the condition (*) and M be a complete space-like hypersurface with constant mean curvature. If M is not maximal and if it satisfies

Balkan Journal of Geometry and Its Applications, Vol.9, No.2, 2004, pp. 32-43. © Balkan Society of Geometers, Geometry Balkan Press 2004.

$$2nc_2 + c_1 > 0,$$

then there exist a positive constant a_1 depending on c_1, c_2, c_3, h and n such that $h_2 \leq a_1$, where the condition (*) means (5.1), (5.2) and (5.3), h_2 denotes the square norm of the second fundamental form.

As an application of this result, we able to make a generalization of some theorem which are investigated by Cheng and Nakagawa ([3]), Ishihara ([7]), Li ([8]), and Nishikawa ([9]) in new different view point.

2 Definitions

Let M' = (M', g') be a Lorentz manifold with a Lorentz metric g' of signature $(-, +, \dots, +)$. M' has uniquely defined torsion-free affine connection ∇' compatible with the metric g'. M' is called *locally symmetric* if the curvature tensor R' of M' is parallel, that is, $\nabla' R' = 0$. Let M be a hypersurface immersed in M'. M is said to be *space-like* if the Lorentz metric g' of M' induces a Riemannian metric g on M. For a space-like hypersurface M there is naturally defined the second fundamental form (the extrinsic curvature) α of M. M is called *maximal space-like* if the mean(extrinsic) curvature H=Tr α , the trace of α , of M vanishes identically. M is maximal space-like if and only if it is extreme under the variations, with compact support through space-like hypersurfaces, for the induced volume. M is said to be *totally geodesic* (a moment of time symmetry) if the second fundamental form α vanishes identically.

3 Preliminaries

Let M be a space-like hypersurface in a Lorentz (n + 1)-manifold M' = (M', g'). We choose a local field of Lorentz orthonormal frames e_0, \dots, e_n are tangent to M' such that, restricted to M, the vectors e_1, \dots, e_n are tangent to M. Here and in the sequel the following convention on the range of indices used throughout this paper, unless otherwise stated:

$$i, j, k, \dots = 1, 2, \dots, n$$
 $\alpha, \beta, \dots, = 0, 1, 2 \dots n$

Let ω_{α} be its dual frame field so that the Lorentz metric g' can be written as $g' = -\omega_0^2 + \sum_i \omega_i^2$. then the connection forms $\omega_{\alpha\beta}$ of M' are characterized by the equations

(3.1)
$$d\omega_i = -\sum_k \omega_{ik} \wedge \omega_k + \omega_{i0} \wedge \omega_0,$$
$$d\omega_0 = -\sum_k \omega_{0k} \wedge \omega_k, \omega_{\alpha\beta} + \omega_{\beta\alpha} = 0.$$

The curvature forms $\Omega'_{\alpha\beta}$ of M' are given by

(3.2)
$$\Omega'_{ij} = d\omega_{ij} + \sum_{k} \omega_{ik} \wedge \omega_{kj} - \omega_{i0} \wedge \omega_{0j},$$
$$\Omega'_{0i} = d\omega_{0i} + \sum_{k} \omega_{0k} \wedge \omega_{ki},$$

and we have

(3.3)
$$\Omega'_{\alpha\beta} = -\frac{1}{2} \sum_{\gamma,\delta} R'_{\alpha\beta\gamma\delta} \omega_{\gamma} \wedge \omega_{\delta},$$

where $R'_{\alpha\beta\gamma\delta}$ are components of the curvature tensor R' of M'. We restrict these forms to M.

 $\omega_0 = 0,$

and the induced Riemannian metric g of M is written as $g = \sum_i \omega_i^2$. From formulas $(3.1) \sim (3.4)$, we obtain the structure equations of M

(3.5)
$$d\omega_{i} = -\sum_{k} \omega_{ik} \wedge \omega_{k}, \quad \omega_{ij} + \omega_{ji} = 0,$$
$$d\omega_{ij} = -\sum_{k} \omega_{ik} \wedge \omega_{kj} + \omega_{i0} \wedge \omega_{0j} + \Omega'_{ij},$$
$$\Omega_{ij} = d\omega_{ij} + \sum_{k} \omega_{ik} \wedge \omega_{kj} = -\frac{1}{2} \sum_{k,l} R_{ijkl} \omega_{k} \wedge \omega_{l},$$

where Ω_{ij} and R_{ijkl} denote the curvature forms and the components of the curvature tensor R of M, respectively. We can also write

(3.6)
$$\omega_{i0} = \sum_{j} h_{ij} \omega_j,$$

where h_{ij} are components of the second fundamental form $\alpha = \sum_{i,j} h_{ij} \omega_i \otimes \omega_j$ of M. Using (3.6) in (3.5) then gives the Gauss formula

(3.7)
$$R_{ijkl} = R'_{ijkl} - (h_{ik}h_{jl} - h_{il}h_{jk}).$$

Let h_{ijk} denote the covariant derivative of h_{ij} so that

(3.8)
$$\sum_{k} h_{ijk}\omega_k = dh_{ij} - \sum_{k} h_{kj}\omega_{ki} - \sum_{k} h_{ik}\omega_{kj}.$$

Then, by exterior differentiating (3.6), we obtain the Codazzi equation

(3.9)
$$h_{ijk} - h_{ikj} = R'_{0ijk}.$$

From the exterior derivative of (3.8) , we define the second covariant derivative of h_{ij} by

$$\sum_{l} h_{ijkl}\omega_{l} = dh_{ijk} - \sum_{l} h_{ijk}\omega_{li} - \sum_{l} h_{ilk}\omega_{lj} - \sum_{l} h_{ijl}\omega_{lk}.$$

Then we obtain the Ricci formula

(3.10)
$$h_{ijkl} - h_{ijlk} = \sum_{m} h_{mj} R_{mikl} + \sum_{m} h_{im} R_{mjkl}$$

The components of the Ricci tensor S and the scalar curvature r of M are given by

$$S_{ij} = \sum_{k} R'_{kikj} - hh_{ij} + h^{2}_{ij},$$

$$r = \sum_{j,k} R_{kjkj} - h^{2} + h_{2},$$

where $h = \sum_{i} h_{ii}$, $h_{ij}^2 = \sum_{r} h_{ir} h_{rj}$ and $h_2 = \sum_{j} h_{jj}^2$. Let us now denote the covariant derivative of $R'_{\alpha\beta\gamma\delta}$, as a curvature tensor of M',

Let us now denote the covariant derivative of $R_{\alpha\beta\gamma\delta}$, as a curvature tensor of M, by $R'_{\alpha\beta\gamma\delta;\eta}$. Then restricting on M, $R'_{0ijk;l}$ is given by

(3.11)
$$R'_{0ijk;l} = R'_{0ijkl} - R'_{0i0k}h_{jl} - R'_{0ij0}h_{kl} - \sum_{m} R'_{mijk}h_{ml},$$

where R'_{0ijkl} denotes the covariant derivative of R'_{0ijk} as a tensor on M so that

$$\sum_{l} R_{0ijkl}^{'} \omega_{l} = dR_{0ijk}^{'} - \sum_{l} R_{0ljk}^{'} \omega_{li} - \sum_{l} R_{0ilk}^{'} \omega_{lj} - \sum_{l} R_{0ijl}^{'} \omega_{lk}.$$

For the sake of brevity, a tensor h_{ij}^{2m} and a function h_{2m} on M, for any integer $m \geq 2$, are introduced as follows:

$$h_{ij}^{2m} = \sum_{i_1,\dots,i_{m-1}} h_{ii_1}^2 h_{i_1i_2}^2 \cdots h_{i_{m-1}j}^2,$$

$$h_{2m} = \sum_i h_{ii}^{2m}.$$

First of all, let us introduce a fundamental property for the generalized maximal principle due to Omori ([10]) and Yau([13]).

Theorem 3.1 ([10], [13]) Let M be a complete Riemannian manifold whose Ricci curvature is bounded from below on M. Let F be a C^2 -function bounded from below on M, then for any $\epsilon > 0$, there exists a point p such that

$$|\nabla F(p)| < \epsilon, \quad \triangle F(p) > -\epsilon \quad and \quad inf \ F + \epsilon > F(p).$$

We also know the following result ([5]).

Theorem 3.2 ([5]) Let M be a complete Riemannian manifold whose Ricci curvature is bounded from below. Let F be a polynomial of the variable f with constant coefficients such that

(3.12)
$$F(f) = c_0 f^n + c_1 f^{n-1} + \dots + c_k f^{n-k} + c_{k+1},$$

where $n > 1, 1 \ge n - k \ge 0$ and $c_0 > c_{k+1}$. If a C²-positive function f satisfies

 $\triangle f \ge F(f),$

then we have

 $F(f_1) \le 0,$

where f_1 denotes the supremum of the given function f.

4 The Laplacian operator

Let M be a space-like hypersurface of an (n + 1)-dimensional Lorentz manifold M'. Then the Laplacian Δh_{ij} of the components h_{ij} of α is defined by

$$\triangle h_{ij} = \sum_k h_{ijkk}.$$

From (3.9) we have

and from (3.10) it follows that

(4.2)
$$h_{kijk} = h_{kikj} + \sum_{m} h_{mi} R_{mkjk} + \sum_{m} h_{km} R_{mijk}.$$

By using (3.9), replace h_{kikj} in (4.2) by $h_{kkij} + R'_{0kikj}$ and substitute the right hand side of (4.2) into h_{kijk} in (4.1). Then we get

From (3.7), (3.11) and (4.3) we have

36

$$(4.4) \quad \triangle h_{ij} = \sum_{k} h_{kkij} + \sum_{k} R'_{0kik;j} + \sum_{k} R'_{0ijk;k} + \sum_{k} (h_{kk} R'_{0ij0} + h_{ij} R'_{0k0k}) + \sum_{m,k} (h_{mj} R'_{mkik} + 2h_{mk} R'_{mijk} + h_{mi} R'_{mkjk}) - \sum_{m,k} (h_{mi} h_{mj} h_{kk} + h_{km} h_{mj} h_{ik} - h_{km} h_{mk} h_{ij} - h_{mi} h_{mk} h_{kj})$$

5 Some curvature conditions

Let M' be an (n + 1)-dimensional Lorentz manifold and let M be a space-like hypersurface of M'. For a point x in M let $\{e_0, e_1, \dots, e_n\}$ be a local field of orthonormal frames of M' around of x in such a way that, restricted to M, the vectors e_1, \dots, e_n are tangent to M and the other is normal to M. Accordingly, e_1, \dots, e_n are space-like vectors and e_0 is a time-like one. For linearly independent vectors u and v in the tangent space $T_x M'$, by which the non-degenerate plane section is spanned, we denote by K'(u, v) the sectional curvature of the plane section in M' and by R' or Ric'(u, u) the Riemannian curvature tensor on M or the Ricci curvature in the direction of u in M', respectively. Let us denote by ∇' the Riemannian connection on M'. We assume that the ambient space M' satisfies the following three conditions : For some constants c_1, c_2 and c_3

(5.1)
$$K'(u,v) = \frac{c_1}{n},$$

for any space-like vector u and time-like vector v,

for any space-like vectors u and v

$$(5.3) |\nabla' R'| \le \frac{c_3}{n}.$$

When M' satisfies the above conditions (5.1), (5.2) and (5.3), it is said simply for M' to satisfy the (*) condition.

Remark 5.1 It can be easily seen that $c_3=0$, then the ambient space M' is locally symmetric.

Remark 5.2 If M is maximal, then the condition (5.1) can be replaced by

for any time-like vector v.

If M' satisfies the conditions (5.4), (5.2) and (5.3), it is said simply for M' to satisfy the condition (*').

Remark 5.3 If M' is a Lorentz space form $M_1^{n+1}(c)$ of index 1 and of constant curvature c, then it satisfies the condition (*'), where $-\frac{c_1}{n}=c_2=c$.

Now we assume that the ambient space M' satisfies the condition (*) and the mean curvature of the hypersurface M is constant. Then the Laplacian of the squared norm h_2 of the second fundamental form α of M is given by

$$\Delta h_2 = \Delta (\sum_{i,j} h_{ij} h_{ij}) = 2 \sum_{i,j,k} (h_{ijk} h_{ij})_k = 2 \sum_{i,j,k} (h_{ijkk} h_{ij} + h_{ijk} h_{ijk})$$

= $2 |\nabla \alpha|^2 + 2 \sum_{i,j,k} h_{ijkk} h_{ij} = 2 |\nabla \alpha|^2 + 2 \sum_{i,j} (\Delta h_{ij}) h_{ij},$

where $\nabla \alpha$ is the covariant derivative of the second fundamental form α and $|\nabla \alpha|$ is the norm of $\nabla \alpha$ which is defined by $\sum_{i,j,k} h_{ijk}h_{ijk}$. Hence, by (4.4) and the assumption $\sum_k h_{kkj}=0$, we have

$$\Delta h_2 = 2|\nabla \alpha|^2 + 2\sum_{i,j} \{\sum_{k} (R'_{0kik;j} + R'_{0ijk;k}) + \sum_{k} (h_{kk}R'_{0ij0} + h_{ij}R'_{0k0k}) \\ + \sum_{k,m} (2h_{km}R'_{mijk} + h_{mj}R'_{mkik} + h_{mi}R'_{mkjk}) - hh_{ij}^2 + h_2h_{ij}\}h_{ij}.$$

Thus we get

(5.5)
$$\Delta h_2 = 2|\nabla \alpha|^2 + 2\sum_{i,j,k} h_{ij} (R'_{0kik;j} + R'_{0ijk;k})$$

+ $2(\sum_{i,j} hh_{ij} R'_{0ij0} + h_2 \sum_k R'_{0k0k})$
+ $4(\sum_{i,j,k,m} h_{ij} h_{km} R'_{mijk} + \sum_{j,k,m} h^2_{mj} R'_{mkjk}) - 2(hh_3 - h^2_2),$

where we have denoted by $h_{ij}^3 = \sum h_{ir} h_{rj}^2$ and $h_3 = \sum h_{ii}^3$. Since the matrix $H = (h_{ij})$ can be diagonalized, the component of h_{ij} of H can be expressed by

(5.6)
$$h_{ij} = \lambda_i \delta_{ij},$$

where λ_i is the principle curvature on M. By definition, we see

$$\lambda_i^2 \le h_2 = \sum_i \lambda_i^2,$$

and hence we have

$$(5.7) -\sqrt{h_2} \le \lambda_i \le \sqrt{h_2},$$

$$(5.8) -h_2 \le \lambda_i \lambda_j \le h_2$$

Now, we estimate (5.5) from above. First, we treat with the second term of (5.5). It is seen that we have

$$\begin{split} -2\sum_{i,j,k}(R_{0kik;j}^{'}+R_{0ijk;k}^{'})h_{ij} &= -2\sum_{j,k}\lambda_{j}(R_{0kjk;j}^{'}+R_{0jjk;k}^{'})\\ &\leq 2\sum_{j,k}|\lambda_{j}|(|R_{0kjk;j}^{'}|+|R_{0jjk;k}^{'}|). \end{split}$$

So by (5.3) and (5.7) we have

(5.9) the second term of
$$(5.5) \ge -4c_3\sqrt{h_2}$$

Next, we consider the third term of (5.4). It is estimated as follows:

$$\begin{aligned} 2(\sum_{i,j} hh_{ij} R_{0ij0}^{'} &+ h_2 \sum_{k} R_{0k0k}^{'}) &= 2\sum_{k} (h\lambda_k R_{0kk0}^{'} + h_2 \sum_{k} R_{0k0k}^{'}) \\ &= 2\sum_{k} (h_2 - h\lambda_k) R_{0k0k}^{'} &= 2\sum_{k} (h_2 - h\lambda_k) \frac{c_1}{n}, \end{aligned}$$

where we have used (5.1). Hence we have

(5.10) the third term of
$$(5.5) = \frac{2c_1(nh_2 - h^2)}{n}$$
.

It is evident that if the ambient space M' is a Lorentz space form $M_1^{n+1}(c)$ of constant curvature c and if the hypersurface M is maximal, then it also holds under (5.4), namely if M' satisfies the condition (*'), then the third term of (5.5) $\geq 2c_1h_2$. Last we estimate the fourth term of (5.5). We have by (5.2)

$$4(\sum_{i,j,k,m} h_{ij}h_{km}R'_{mijk} + \sum_{j,k,m} h^2_{mj}R'_{mkjk}) = 4\sum_{j,k} (\lambda_j\lambda_k R'_{kjjk} + \lambda_j^2 R'_{kjkj})$$
$$= 4\sum_{j,k} (\lambda_j^2 - \lambda_j\lambda_k)R'_{kjkj} = 2\sum_{j,k} (\lambda_j - \lambda_k)^2 R'_{kjkj} \ge 2c_2\sum_{j,k} (\lambda_j - \lambda_k)^2.$$

Accordingly, we obtain

(5.11) the fourth term of $(5.5) \ge 4c_2(nh_2 - h^2)$,

where we have used the formula

$$\sum_{j,k} (\lambda_j - \lambda_k)^2 = 2n \sum_j \lambda_j^2 - 2 \sum_{j,k} \lambda_j \lambda_k = 2n \sum_j \lambda_j^2 - 2(\sum_j \lambda_j)^2$$

and the definitions of $h_2 = \sum_j \lambda_j^2$ and $h^2 = (\sum_j \lambda_j)^2$. Thus, substituting (5.9), (5.10) and (5.11) into (5.5), we can prove the following.

Lemma 5.4 Let M' be an (n + 1)-dimensional Lorentz manifold satisfying the condition (*) and M a space-like hypersurface of M'. If its mean curvature is constant, then we have

(5.12)
$$\Delta h_2 \ge -4c_3\sqrt{h_2} + \frac{2(2nc_2+c_1)(nh_2-h^2)}{n} - 2(hh_3-h_2^2).$$

In particular, if M is maximal, we have

$$\Delta h_2 \ge -4c_3\sqrt{h_2 + 2(2nc_2 + c_1)h_2 + 2h_2^2}.$$

Also, if $M' = M_1^{n+1}(c)$, then we obtain

$$\Delta h_2 \ge 2c(nh_2 - h^2) - 2(hh_3 - h_2^2).$$

6 Proof of Main Theorem

Let M' be an (n + 1)-dimensional Lorentz manifold and let M be a complete hypersurface of M' with constant mean curvature. Assume that the ambient space satisfies the condition (*). The condition (*) is defined by (5.1), (5.2) and (5.3). Now, by (5.12) in Lemma 5.1 the function h_2 satisfies

$$\Delta h_2 \ge -4c_3\sqrt{h_2} + frac_2(2nc_2 + c_1)(nh_2 - h^2)n - 2(hh_3 - h_2^2).$$

Moreover, we obtain

(6.1)
$$-2hh_3 = -2h\sum_i h_{ii}^3 = -2h\sum_j \lambda_j^3 \ge -2h\sum_j \sqrt{h_2}^3 = -2nhh_2\sqrt{h_2},$$

from which together with (5.12) it follows that

(6.2)
$$\Delta h_2 \ge -4c_3\sqrt{h_2} + 2(2nc_2 + c_1)(h_2 - \frac{h^2}{n}) - 2nhh_2\sqrt{h_2} + 2h_2^2.$$

Now we define a non-negative function f by $f^2 = h_2$. Then it turns out to be

Proof of the Main Theorem

Let $\lambda_1, \dots, \lambda_n$ be principal curvatures on M. The Ricci tensor S_{ij} is expressed by

$$S_{ij} = \sum_{k} (R'_{kikj} - h_{ij}h_{kk} + h_{ik}h_{jk}).$$

So we have

$$S_{jj} \ge (n-1)c_2 - h\lambda_j + \lambda_j^2 \ge (n-1)c_2 - \frac{h^2}{4}$$

which yields the Ricci curvature of M is bounded from below. For the function f defined by $f^2 = h_2$, by (6.3) we have

$$\triangle f^2 \ge F(f^2),$$

where the function F(x) is defined by

$$F(x) = 2[x^2 - nhx^{\frac{3}{2}} + (2nc_2 + c_1)x - 2c_3x^{\frac{1}{2}} - \frac{h^2}{n}(2nc_2 + c_1)].$$

By comparing with (3.12), we get

n = 2, $n - k = \frac{1}{2}$, $c_0 = 2$, $c_{k+1} = -\frac{2h^2(2nc_2+c_1)}{n}$, where we have used $2nc_2 + c_1 > 0$. Now we are able to apply Theorem 3.2 to the function f^2 . Then we obtain

(6.4)
$$F(f_1^2) \le 0,$$

where f_1^2 denotes the supremum of the given function f^2 .

We define the function y = y(x) of the variable x by

$$y = y(x) = x^{4} - nhx^{3} + (2nc_{2} + c_{1})x^{2} - 2c_{3}x - \frac{h^{2}}{n}(2nc_{2} + c_{1}).$$

By the assumption $2nc_2+c_1 > 0$ and the fact that the hypersurface is not maximal, the algebraic equation y(x) = 0 with constant coefficients has positive roots because y(0) < 0 and it converges to infinity as x tends to infinity. We denote by $\sqrt{a_1}$ $(a_1 > 0)$ the minimal root among the positive roots. So it depends only on the constant coefficients, namely, it depends on c_1, c_2, c_3, h and n, and by definition we see that

$$y|[0,\sqrt{a_1}) < 0$$

From the above equation together with (6.4) it follows that we have $0 \le f_1 \le \sqrt{a_1}$. Since the squared norm h_2 of the second fundamental form is given by $h_2 = f^2$, we have

$$\sup h_2 = f_1^2 \le a_1.$$

So we get the conclusion. \Box

If the hypersurface M is maximal, then we have by (6.3)

$$\Delta f^2 \ge 2\{f^4 + (2nc_2 + c_1)f^2 - 2c_3f\} = F(f^2),$$

where a non-negative function f is defined by $f^2 = h_2$. By a similar method to the proof of our Main Theorem, we have

(6.5)
$$F(f_1^2) \le 0,$$

where f_1 denotes the supremum of the function f. We define a function y of the variable x by

$$y = y(x) = x\{x^3 + (2nc_2 + c_1)x - 2c_3\}.$$

By the direct calculus, there exists a unique positive root of the equation y(x) = 0, say $\sqrt{a_1}$, if $c_3 > 0$.

Corollary 6.1 Let M' be an (n+1)-dimensional Lorentz manifold which satisfies the condition (*) and let M be a complete space-like maximal hypersurface. If M' is not locally symmetric, then there exists a positive constant a_1 depending on $c_1, c_2, c_3(> 0)$, h and n such that $h_2 \leq a_1$.

Remark 6.2 Corollary 6.1 was proved by Li ([8]) under the additional condition $c_3^2 + \frac{(2nc_2+c_1)^3}{27} < 0.$

Remark 6.3 In the case where the ambient space is locally symmetric and it satisfies the condition (*'), the constant a_1 is the positive root of the algebraic equation

$$F(x^{2}) = x^{2} \{ x^{2} + (2nc_{2} + c_{1}) \} = 0,$$

which yields that if $2nc_2 + c_1 \ge 0$, then $F|(0,\infty) > 0$, which means that we have no positive roots. In the case where $2nc_2 + c_1 < 0$ there exists a unique positive root of the equation y(x) = 0, say $\sqrt{a_1}$. In the first case, considering (6.5) we have $f_1 = 0$. By definition of $f_1 = \sup f$ for the non-negative function f, we see that f vanishes identically on M. It yields that M is totally geodesic. So if it satisfies $2nc_2 + c_1 < 0$, then we have $a_1 = -(2nc_2 + c_1)$. This result was derived by Li ([8]). The first assertion of Corollary 6.1 was also proved by Nishikawa([9]). In particular, when $M' = H_1^{n+1}(c)$, this reduces to Ishihara's theorem ([7]).
